ref per-instance member variable, stored by React rather than by you, which React promises not to re-render over when you write to it.

- React is pull and event driven, while the render loop continuously reads and renders. Therfore, there is no setter function needed.

prop short for property, the way we pass configuration from the parent to the child

- Interface typeannotation
- `{}` destructuring
- optionals

tuple types R3F requires exact quantity of members for certain jsx elements

```
const exact: [number, number, number] = [3, 4, 5];
<directionalLight position={exact} />
```
